RE: Important health information for _

To all teachers and administrators involved with my child's education,

has been diagnosed with a rare and potentially life-threatening genetic disease called Hereditary Angioedema (HAE). HAE symptoms include episodes of swelling (edema) in all various parts of the body, including the hands, feet, face, and airway.

Important: All attacks of angioedema involving the upper airway are medical emergencies and must be treated immediately. In addition, emergency department assessment is recommended.

Call 911 immediately if the child reports swelling in the throat, you notice a change in the pitch of his/her voice, or he/she exhibits any difficulty breathing.

On occasion,	_ may recognize signs of HAE swelling and may need to be excused
from school.	

	is currently under the care of Dr	;	, who can be reached
during office hours at			

If _ ____ begins to recognize the symptoms of an HAE attack, immediately contact one of the following people who have been trained to administer their medication:

HAE attacks often occur spontaneously and can be triggered by many things:

(e.g., social or academic)

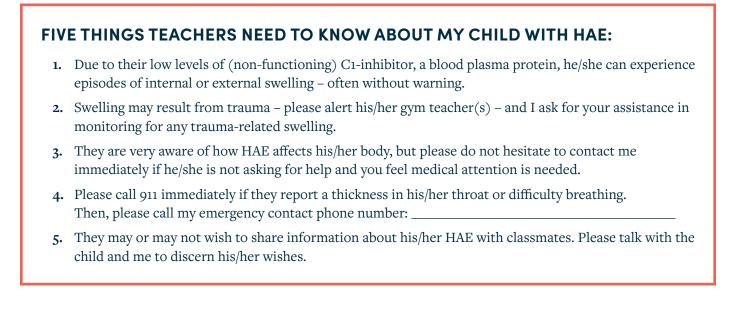

INFECTIONS (e.g., cold or flu)

ABOUT HAE

HAE occurs in about 1 in 10,000 to 1 in 50,000 people. HAE symptoms include episodes of swelling (edema) in various parts of the body, including the hands, feet, face, and airway.

HAE is not allergic swelling, although it may share a similar appearance. HAE does not respond to antihistamines or corticosteroids.

In addition, abdominal swelling can be accompanied by nausea, vomiting, and excruciating pain.
